## Student safety sheets

# Ammonia (gas & solution)

30

also applies to Ammonium hydroxide

Substance	Hazard	Comment
Ammonia		DANGER: Causes severe skin burns and eye damage. Toxic if
(Gas)		inhaled. Flammable gas. Very toxic to aquatic organisms.
	<b>v v</b>	For a 15-minute exposure, the concentration in the
	CORROSIVE TOXIC	atmosphere should not exceed 25 mg m <sup>-3</sup> . Effects of
		exposure develop or increase over some time. Inhalation
		may exacerbate the problems of those with asthma etc.
	ENVIRONMENT	However, the human nose can detect ammonia at well below danger levels.
Concentrated ammonia solution		DANGER: Causes severe skin burns and eye damage.
(If 3 M or more)		Respiratory irritant. Very toxic to aquatic organisms.
Ammonium hydroxide solution;	CORROSIVE IRRITANT	Ammonia gas will be present and the pressure of gas
35 % w/w (18 M) ammonia is	XV	builds up on hot days – open cautiously in a fume
commercially available, density		cupboard.
0.880 g cm <sup>-3</sup> , hence often called '880	ENVIRONMENT	'Household' ammonia is about 6 M.
Ammonia . Moderately concentrated	~	DANCER: Causas sovere eve damage: irritates skip
woderately concentrated	N W	DANGER. Causes severe eye danlage, initiates skiil.
ammonia solution		its odour can cause distress.
(If less than 3M but 1.8 M or more)	CORROSIVE	
Moderately dilute ammonia		WARNING: irritates skin and eyes.
solution		
(If less than 1.8 M but 0.6 M or more)	IRRITANT	
Dilute ammonia solution		It may still cause harm in eyes or in a cut.
(If less than 0.6 M)	LOW MALAND	

#### Typical control measures to reduce risk

- Use the lowest concentration possible.
- Wear suitable eye protection including when making or disposing of solutions
- Use a fume cupboard for all but test tube amounts of the gas and more concentrated solutions (including opening bottles); ensure good laboratory ventilation.
- If smelling the gas, follow the safe technique for sniffing gases: use your hand to waft the gas towards your nose.

### Assessing the risks

CLEAP55

- What are the details of the activity to be undertaken? What are the hazards?
- What is the chance of something going wrong? eg, solution spurting out of test tubes when being heated; release of ammonia gas as a product of a chemical reaction; possibility of the ammonia gas concentration reaching dangerous levels.
- How serious would it be if something did go wrong?
  NB Alkali in the eye causes more damage than acid of equivalent concentration.
- How can the risk(s) be controlled for this activity? eg, can it be done safely? Does the procedure need to be altered? Should goggles or safety spectacles be worn?

#### Emergency action

_		
•	In the eye	Flood the eye with gently-running tap water for at least 20 minutes. Consult a medic. If it is necessary to go to hospital, continue washing the eye during the journey in an ambulance.
•	Vapour breathed in	Remove the casualty to fresh air. Consult a medic if breathing is difficult.
•	Swallowed	Do no more than wash out the mouth with drinking water. Do <b>not</b> induce vomiting. Consult a medic.
•	Spilt on the skin or clothing	Remove contaminated clothing. Then drench the skin with plenty of water. If a large area is affected or blistering occurs, consult a medic .
•	Spilt on the floor, bench, etc	<b>Consider the need to evacuate the laboratory and open windows</b> if large amounts are spilt and especially for (moderately) concentrated solutions. Cover with mineral absorbent (eg, cat litter) and scoop into a bucket. Neutralise with citric acid. Rinse with plenty of water. Wipe up small amounts with a damp cloth and rinse it well.
