

Food testing (1)

See also CLEAPSS Student Safety Sheet 5, Food Testing (2)

Source	Hazard	Comment
Food	 BIOHAZARD	Uncooked samples of food may be contaminated with microbes. (See CLEAPSS Student Safety Sheet 1, Microorganisms.) Some people are allergic to some foods, especially peanuts.
Fehling's solution Used to test for reducing sugars	 CORROSIVE	See CLEAPSS Student Safety Sheets 31 and 40. Solution A contains slightly-acidic copper sulfate solution. Solution B contains 3 M sodium hydroxide solution. Solution A: DANGER: Causes serious eye damage and skin irritation. Solution B: DANGER: Causes severe eye damage and skin burns. As the mixture has to be heated in a test tube, there is a risk of alkali spitting out.
Benedict's solution Used to test for reducing sugars	 IRRITANT	See CLEAPSS Student Safety Sheet 40. Contains slightly-alkaline 0.07 M copper sulfate solution. WARNING: Irritant to skin and eyes. Some risk of spitting when heating test tubes.
Ethanol Used to test for fats (lipids)	 HIGHLY FLAMMABLE  HARMFUL  HEALTH HAZARD	Most schools use IDA (industrial denatured alcohol) rather than pure ethanol. See CLEAPSS Student Safety Sheet 60. DANGER: highly flammable, harmful by ingestion, may cause damage to organs, causes serious eye irritation. If Bunsen burners are being used nearby for other food tests, there is a serious fire risk.
Iodine solution Used to test for starch	Currently not classified as hazardous	See CLEAPSS Student Safety Sheet 56. The solution is so dilute (about 0.01 M) that it is currently not classified as hazardous
Biuret test Used to test for proteins	 CORROSIVE	See CLEAPSS Student Safety Sheets 31 and 40. DANGER/WARNING: The very dilute copper sulfate solution is currently not classified as hazardous. Sodium hydroxide solution may be CORROSIVE, IRRITANT or currently not classified as hazardous depending on concentration.

Typical control measures to reduce risk

- Do not taste foods in laboratories; avoid using products containing peanuts etc if there is a known allergy.
- Wear eye protection and use the smallest possible amounts of chemicals.
- Use Benedict's solution rather than Fehling's solution and heat with a water bath.
- Do not use ethanol if there are naked flames nearby.

Assessing the risks

- What are the details of the activity to be undertaken? What are the hazards?
- What is the chance of something going wrong?
eg, could chemicals spit out of a heated test tube, or might somebody using a Bunsen be unaware of ethanol being used nearby?
- How can the risk(s) be controlled for this activity?
eg can it be done safely? Does the procedure need to be altered? Should goggles or safety spectacles be worn?

Emergency action

In all emergency situations, alert the responsible adult immediately. Be aware that actions may include the following:

- In the eye Irrigate the eye with gently running tap water for at least 20 minutes. Call 999/111.
- In mouth/swallowed Do no more than rinse and spit with drinking water. Do **not** induce vomiting. Call 999/111.
- Spilt on the skin or clothing Remove contaminated clothing. Irrigate the affected area with gently running tap water for 20 minutes. If a large area is affected or symptoms occur, call 999/111.
- Clothing catches fire Push casualty to the floor, roll the body or smother flames on clothing or skin with fire blanket or other material. Cool burnt skin with gently running tap water for 20 minutes. Unless trivial, call 999/111.
- Other ethanol fires Allow fires in sinks, etc to burn out. Fires at the top of test tubes, beakers etc can be smothered with a damp cloth or heat-resistant mat if this can be done safely.
- Spilt on the floor, bench, etc For small amounts, use a damp cloth. Rinse well. For larger amounts, cover with mineral absorbent (eg, cat litter) and scoop into a bucket. Neutralise alkali with citric acid. Rinse with water.
